Abdallah Abdulazeez

Personal portfolio website - development and verification report

Content and visual direction

Five linked pages present my introduction, education and experience, four projects, technical skills, and contact details. The site uses plain HTML, one external CSS stylesheet, and vanilla JavaScript. A pale-mint, navy, teal, and burgundy palette provides a professional light theme, with a coordinated dark theme. The circular professional and graduation portraits share a headshot frame and flip on request. A prominent LinkedIn link appears on every page.

An engineering story based on the real build

The Protolight sequence follows sensing, response, and assembly. Its vector reconstruction matches the actual L-shaped enclosure, LED channels, Arduino circuit, and sensor placement. As visitors scroll down, parts assemble and reveal the real final prototype photo; scrolling up reverses the sequence. Cached section geometry keeps the state correct during fast jumps and resizing. Phones use a compact sticky visual. The project page includes actual CAD revisions and build photos from the supplied engineering notebook.

Interaction, motion, and accessibility

A persistent light/dark control follows the device theme until a visitor chooses otherwise. A pausable ribbon lists CAD, fabrication, electronics, software, and language skills. A small animated ring accompanies fine mouse pointers without replacing the native cursor. Touch devices omit it. Reduced-motion settings stop nonessential animation and return the story to normal flow. The responsive menu supports keyboard use and Escape; the contact form validates input and prepares an email draft without sending or storing a message.

Challenges and corrected Codex mistakes

The initial section-entry approach could leave the story behind when scrolling upward. I replaced it with scroll-position-based progress and verified both directions, fast jumps, and resizing. Lighthouse also exposed a layout jump while the mobile header initialized; reserving its geometry before paint fixed that shift. Responsive project images reduced the phone photo from 412 KB to 85 KB, and the alternate portrait now loads on intent. Earlier hero-overflow and direct-file font issues were fixed and retested.

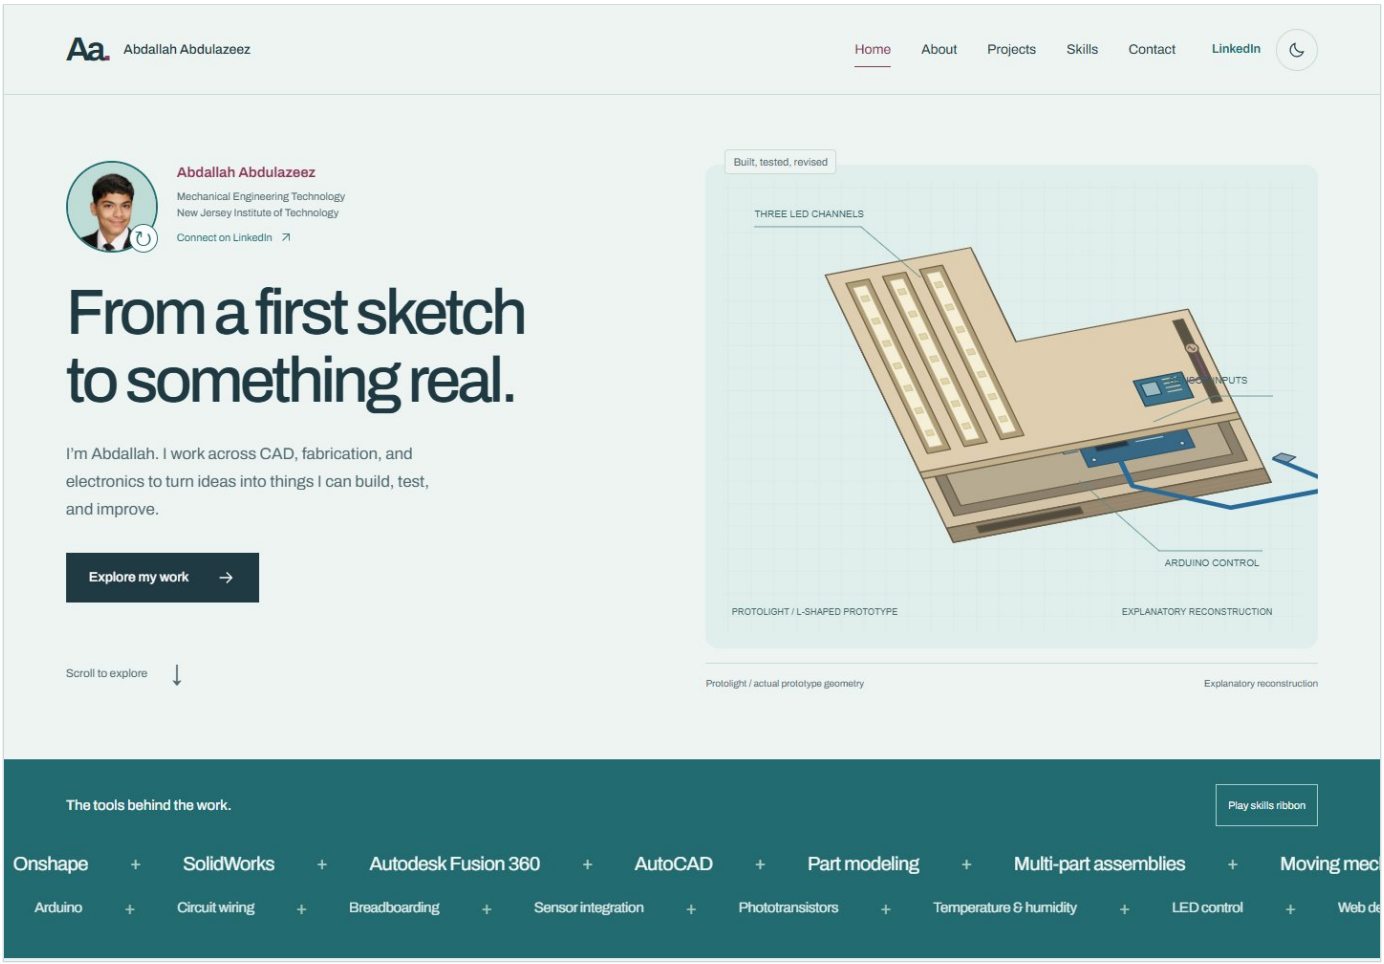

Live testing and deployment

GitHub Pages publishes main from the repository root. All 63 live browser checks passed, covering navigation and keyboard use on every page, the reverse scroll story, portraits, themes, ribbon controls, cursor behavior, form validation, and responsive layouts. All five pages scored 100 for Lighthouse accessibility, best practices, and SEO in both themes. Light-theme mobile performance scores: Home 98, About 100, Projects 99, Skills 99, Contact 100. TESTING.md records complete cases, observed issues, fixes, and retests; machine summaries are included in the repository.

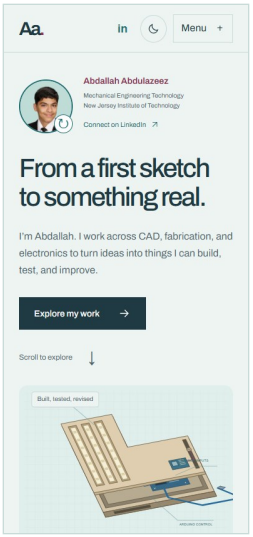

Prepared with Codex assistance. Protolight media is genuine; the badge, HafizAI, and soil-tilling visuals remain labeled placeholders awaiting owner-supplied media. The owner still needs to review the code, practice on physical devices, perform the class demo, and submit this report. Commit dates are honest; this session does not claim work across multiple days.

One site. Light, dark, and mobile.

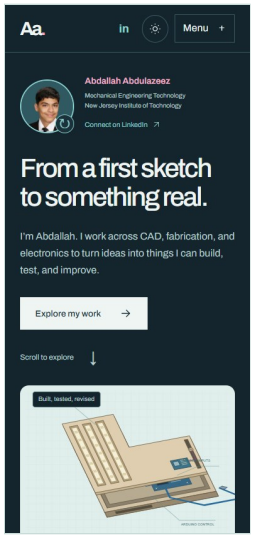

Genuine screenshots of the live GitHub Pages site, captured October 29, 2026. Phone images use viewport emulation; physical-device demonstration remains a personal step.

Phone / dark

Consistent portrait framing

Both portraits use the same circular headshot dimensions, with CSS cropping that preserves the photographs. The theme, navigation, and LinkedIn controls remain available at phone width.

Built to keep working

Native scrolling and the native mouse cursor remain intact. Reduced motion offers a static reading experience, and the five pages still work when opened directly from disk. All published images stay below 500 KB.
