# Engineering, made visible.

Personal portfolio website - development and deployment report

## Features and implementation

Five linked pages introduce my background, education, projects, skills, and contact details. Four resume-based projects cover Protolight, an illuminated vehicle badge, HafizAI, and a soil-tilling CAD assembly. The design uses drawing-paper tones, graphite text, burgundy accents, and a locally hosted Archivo font. The site uses semantic HTML, one external CSS stylesheet, and plain JavaScript; it needs no backend, framework, npm installation, or build step.

## Motion that explains the work

The homepage tells the Protolight story in three stages: sensing conditions, responding with an Arduino control circuit, and building the printed housing. IntersectionObserver updates a sticky illustration, and CSS transforms bring individual assembly layers together. Mobile layouts use a normal vertical sequence. A persistent motion control and operating-system reduced-motion support disable nonessential animation. A responsive menu and validated email-draft form provide additional interactions.

## Challenges and a corrected Codex mistake

The first hero animation translated the image beyond its figure, briefly making the live 320px page 327px wide. Browser testing exposed the mistake. Adding overflow containment to the figure fixed it, and the live small-screen retest passed. A second compatibility issue came from a font preload blocked by Chrome on direct file URLs; removing the preload made all five pages open from disk without console errors. The font was also reduced from about 659 KB to 35 KB.

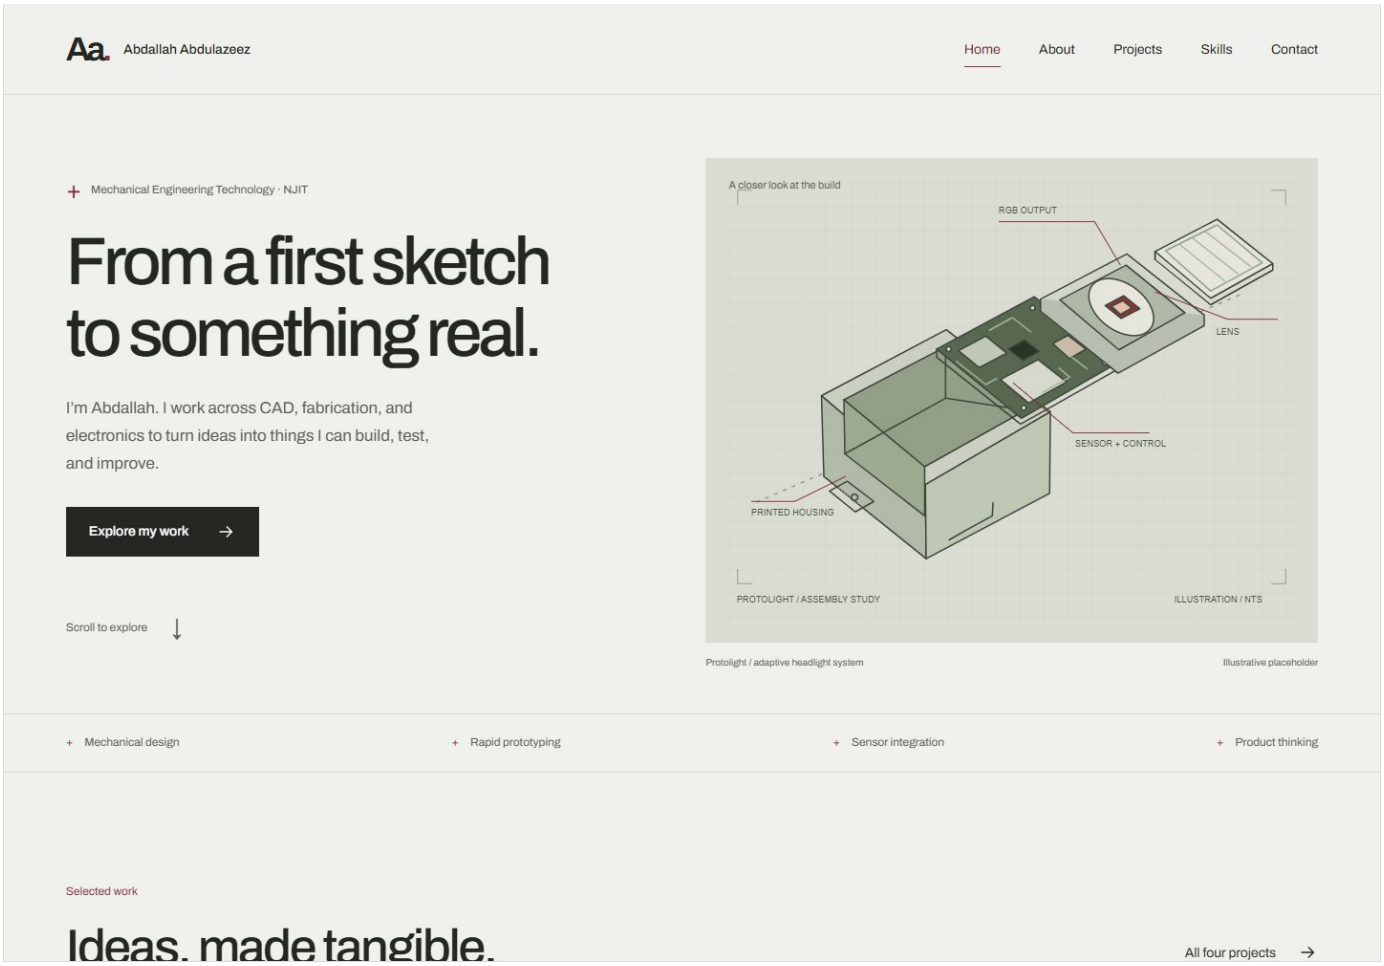

## Testing and deployment

GitHub Pages publishes the public repository from main and the root folder. All 41 live browser checks passed, covering every main navigation link from every page at desktop and mobile widths, keyboard use, menu states, motion, form validation, narrow screens, and no-JavaScript behavior. All five pages scored 100 for Lighthouse accessibility, best practices, and SEO. Mobile-preset performance scores were Home 98, About 99, Projects 99, Skills 100, and Contact 100. Additional checks covered 98 local references, image sizes, direct-file opening, and unobscured keyboard focus.

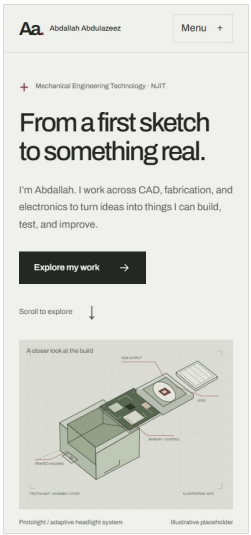

Prepared with Codex assistance. Project illustrations remain clearly labeled placeholders at the owner's request. Real project photos and a HafizAI URL can be added later. The owner still needs to review the code, demonstrate the site on physical devices, and submit this report. Commits retain their honest dates; this session does not satisfy a requirement for work spread over multiple days.

# The live site, at two sizes.

Genuine screenshots of GitHub Pages captured October 29, 2026. The phone image uses browser viewport emulation, not a physical device.

Laptop viewport / 1440 x 1000 CSS pixels

## Phone viewport / 390 x 844

The introduction and primary action stay readable at phone width. The navigation becomes a labeled menu button, project previews stack vertically, and the scroll story becomes ordinary document flow.

## A portfolio that can grow

The placeholders are isolated in assets/images and can be replaced with actual project media. Shared CSS and JavaScript keep the five pages consistent. TESTING.md records the test plan, observed failures, fixes, and passing retests; DEMO.md supports the three-minute presentation.
